PROFILE

I am a second-year Computer Science student at the University of Leeds, on a degree with a formal, assessed 12-month year in industry. I work across the full stack, from React and Vue frontends through Python and FastAPI services to PostgreSQL and Supabase data layers, and have shipped a dozen projects across client work, hackathons, coursework and personal builds. I publish daily programming work to an audience of 2,000+ as code_dailybuild, and pair a foundation in algorithms, data structures and databases with a sustained interest in equity markets. I am currently searching for a 12-month industrial placement between my second and final year, starting summer 2027, to expand my skills and knowledge inside a professional engineering team.

EDUCATION

BSc Computer Science (Industrial) · University of Leeds

2025 to 2029

- I am working towards a 2:1 or above. The programme includes an assessed 12-month industrial placement, scheduled for 2027/28.
- Relevant modules: Algorithms and Data Structures, Object-Oriented Programming, Databases, Software Engineering.
- My coursework spans imperative, object-oriented and functional styles, relational modelling and query design, and team-based software engineering practice.

A Levels · Elliot Hudson College

2023 to 2025

- Mathematics A · Further Mathematics B · Computer Science B

GCSEs · Leeds West Academy

2022 to 2023

- Mathematics 9 · English 6 · Science (Double Award) 7-7 · Silver Mathematics Award

EXPERIENCE

Freelance Developer and Technical Tutor · Self-Employed

2024 to Present

- I have delivered 5+ client websites end to end in TypeScript, JavaScript, React, Vue.js and Python, backed by Supabase and PostgreSQL, released through Git-triggered continuous deployment on Vercel.
- I gather requirements from non-technical clients, translate them into a written specification, then develop, test, troubleshoot and maintain the result, covering every stage of the software development life cycle independently.
- I manage scope, revisions and handover directly with each client, sustaining delivery alongside full-time study.
- I have tutored 10+ GCSE students in mathematics and the sciences, adapting my explanations of technical material to different levels of confidence.

Creator and Programmer · code_dailybuild, TikTok and Instagram

Ongoing

- I run a programming content page which has grown to 2,000+ followers and 30,000+ likes, where I publish short-form builds and explanations for a general audience.
- I am currently producing a 100-day series in which I attempt a new Python project every day, sustaining a daily build-and-publish cadence alongside a full-time degree.
- I compress technical decisions into short, clear explanations, which has sharpened my communication under a fixed format and a fixed deadline.

Photographer and Media Lead · University of Leeds Pakistani Society

Jun 2026 to Present

- I was elected to a committee of 10 serving a membership of 200+, and I own photography and media output across the society calendar.
- I coordinate with events and social leads to plan, shoot, edit and publish coverage, driving attendance and engagement year-round.
- I maintain the society web presence and visual identity, keeping listings and media assets current between events.

Hackathon Participant · LeedsHack 2026

2026

- I shipped Community Connect, a full-stack events and messaging platform, in a team of 4 over 24 hours, dividing the work, integrating branches under time pressure and demonstrating the product to judges.
- I scoped the build to what four people could realistically finish in a day, trading breadth of features for a working end-to-end demonstration.

EARLY EXPERIENCE AND ENRICHMENT

Work Experience · Munroe K

2024

- I worked in a team of three to redesign a commercial workspace floor plan, and presented the concept to stakeholders.
- I developed transferable skills in project planning, creative problem solving and professional presenting.

Employability Programme · Sparks Mentoring

2024

- I completed a structured professionalism and workplace readiness programme.
- I met engineers from the MARS IT department and learned how enterprise server infrastructure and corporate networks are built and maintained.

Workplace Visit · The British Library

2024

- I observed the AI, robotics and software systems used to catalogue and store all UK-published content at scale.

SELECTED PROJECTS

AIWardrobe

React · FastAPI · Supabase · JWT · REST · Tailwind CSS

- I built this after watching a family member struggle with an overfilled wardrobe: a system that recommends outfits from a catalogued garment collection.
- I designed a decoupled architecture: a React and Tailwind frontend consuming a FastAPI REST backend, secured with JWT authentication so the backend verifies tokens without ever handling raw passwords.
- I weighed a machine learning recommender against a rule-based engine scoring garment combinations on colour harmony and formality, and chose the latter for speed, low cost and explainability.
- I configured both tiers for deployment with environment-based settings and CORS handling across separate origins.

Community Connect

Vue.js · TypeScript · Python · Supabase

- A full-stack community events platform I built at LeedsHack 2026, letting users discover local events, join communities and chat in real time.
- I owned the Python and Supabase backend, defining the data model for users, events and messages, and integrating it with a Vue.js and TypeScript frontend.
- I agreed interfaces with my teammates up front so frontend and backend work could progress in parallel and land live within the hackathon timeframe.

Distributed micro:bit Sensor Network

Python · Pandas · Matplotlib · Networking

- I configured and networked multiple hardware sensor nodes to capture environmental data, diagnosing connectivity and reliability faults across the network.
- I achieved stable, reliable datalogging by combining hardware and software in a modular workflow backed by unit testing.
- I built a real-time data pipeline in Pandas and Matplotlib to process incoming readings and generate visual insights.

2D Platformer Game

Unity · C# · OOP · Agile

- I built a complete 2D platformer from scratch, featuring level progression, collectibles, enemy AI, a health and lives system, buffs and de-buffs, and scaling difficulty.
- I decomposed the project into 14 core features delivered across 8 structured development sprints.
- I verified reliability through function, robustness and usability testing against defined success criteria.

Equity and ETF Market Tracker

Python · REST APIs · Pandas · SQL

- This grew out of managing my own equity and ETF portfolio since 2024, concentrated in the memory and semiconductor sector, where I was making screening and rebalancing decisions from a spreadsheet updated by hand.
- It automates retrieval of large market datasets over REST APIs, then validates, cleans and stores them, removing that manual step.
- I track sector events such as memory manufacturer earnings and broader market contagion, structuring price and holdings data for repeatable analysis. In progress.

- I designed and built a fast, animated, responsive portfolio from scratch to present my projects, skills and experience.
- I took full ownership of a live web project across UI design, responsive layout, performance optimisation and Vercel deployment.

FURTHER PROJECTS

- **uolpaksoc.co.uk** [[HTML](#) · [CSS](#) · [JavaScript](#)] The public website for the University of Leeds Pakistani Society, serving a membership of 200+. I built it framework-free and maintain the content by hand, keeping it fast to load and simple for future committees to update.
- **Tutor4U** [[HTML](#) · [CSS](#) · [JavaScript](#)] A tutoring service website I built to connect students with tutors, presenting services and onboarding steps clearly for a non-technical audience.
- **Weather App** [[HTML](#) · [CSS](#) · [JavaScript](#)] Fetches and displays current weather for the user location or any searched city over a REST API. I used it to practise third-party API integration and asynchronous data handling in vanilla JavaScript.
- **Tetris** [[JavaScript](#) · [HTML5](#) · [CSS](#)] I recreated Tetris in the browser from scratch, implementing piece movement, rotation, line clearing and scoring, with a game loop built on DOM manipulation and CSS animation.
- **Drawing Tool** [[JavaScript](#) · [HTML5 Canvas](#) · [CSS](#)] A browser-based drawing application with brush controls, which I built directly on the HTML5 Canvas API.

TECHNICAL SKILLS

Languages Python · JavaScript · TypeScript · C# · C++ · SQL · HTML5 · CSS

Frameworks and Libraries React · Vue.js · FastAPI · Node.js · Tailwind CSS · Vite · Pandas · Matplotlib · Unity

Databases and Data PostgreSQL · Supabase · Firebase · REST APIs · relational modelling · data pipelines · data structures and algorithms

Practice and Tooling Agile and Scrum · Git and GitHub · CI/CD · Vercel · unit testing · JWT and application security · CORS

Hardware and Systems micro:bit sensor networks · hardware and software integration · network fault diagnosis

ADDITIONAL

Languages I am fluent in English, Urdu and Sindhi.

Media I shoot photography and video and edit short-form content, applied across society coverage and the code_dailybuild page.

Interests Photography, hiking, cycling and badminton. I follow equity markets closely, with a particular interest in the memory and semiconductor sector.
